INTRODUCTION

Camel is an important component of desert ecosystem of Gujarat. It is primarily reared for carting/draft, agricultural operation and transportation in addition to the secondary utility of milk and hair production (Saini et al., 2006). India ranks 7th in the world in camel population which is mainly confined to the northern-western part of the country. India possesses mainly dromedary camels. There are 9 indigenous registered breeds of camels in India viz. Jaisalmeri, Jalori, Bikaneri, Kutchi, Malvi, Marwari, Kharai, Mewari and Mewati (NBAGR, 2016). Camels in India are mainly reared by landless nomadic or semi-nomadic tribes as an ancestral business. Camel has a unique ability to convert the scanty plant resources of the desert area into milk, meat and fibre (Ahmad et al., 2010).

Gujarat is having two breeds of Camel i.e. Kutchi and Kharai (a recently recognized breed). Kutchi breed is inhabitant of Kutch and Banaskantha, dry and semi-arid districts of north Gujarat. According to 19th Livestock census, the camel population in Gujarat was 30415 including 16891 males and 13524 females (Livestock census, 2012). Though both Kutchi and Kharai camels share many characters they are not only morphologically distinct but also differ with respect to milk and wool quality. Hence their conservation assumes national priority (Mburu et al., 2003).

The erythrocytic indices are important parameters to be observed for monitoring the health status of animals. The reference values of such indices become helpful in the diagnosis, prevention and control of disease by providing the basis for clinical interpretation of laboratory data. However, the normal levels of haemato-biochemical parameters have been found to be influenced by different physiological conditions.
cal stages of animals (Ahmad et al., 2003). Pregnancy and lactation are two most important stages in the life of animals, which affect metabolism resulting in the alteration of the haemato-biochemical profile (Krajnicakova et al., 2003; Iriadam 2007). However, no such study has beenper formed to investigate the erythrocytic indices during different stages of lactation. Hence, the present study was undertaken to determine the reference values of erythrocytic indices in clinically healthy lactating Kutchi camel during different stages of lactation.

MATERIALS AND METHODS

LOCATION OF STUDY
The study was conducted at Sardarkrushinagar located in Banaskantha district of North Gujarat, in collaboration with Camel Breeding Farm, Dhori (Kutch, Gujarat), which is situated between 22° 44’ 8” to 24° 41’ 30” North Latitude and 68° 7’ 23” and 71° 46’ 45” East Longitude in western India. The maximum annual average temperature and relative humidity of this region is 39-45°C and 63%, respectively. Kutch has wide range of climate conditions varying from dry to humid and extreme cold to hot with wide variation in landscaping.

EXPERIMENTAL ANIMALS
A total of 30 clinically healthy female Kutchi camels (Camelus dromedarius) of 8-10 years old were selected from the herd maintained at Camel Breeding Farm, Dhori (Kutch, Gujarat). These animals were categorized into three groups based on their stage of lactation: early lactation (1-3 months), mid-lactation (4-6 months) and late lactation (≥ 7 months). The average body weight of the animals was about 500 kg with average milk yield of 4-5 kg per day per animal. The selected animals were maintained following standard farm practices. All the camels are left free to graze in the open desert. Adlibitum feed was provided to the animals. The animals appeared clinically healthy with no physical deformities. The health status of the selected animals was evaluated based on behavior, rectal temperature, pulse rate, respiratory rate and faecal consistency. The animals were also examined for parasites and deworming of the animals was done regularly.

COLLECTION OF BLOOD SAMPLES
The whole blood samples were collected in vials containing K<sub>E</sub> EDTA (Tripotassium ethylene diamine tetra acetic acid) supplied by P.H. Polyplast, Thane, India, for haematological analysis.

HEMATOLOGICAL ANALYSIS
Blood samples were analyzed for different erythrocytic indices viz. total erythrocyte count (TEC), hematocrit (HCT)/packed cell volume (PCV), hemoglobin (Hb), mean corpuscular volume (MCV), mean corpuscular hemoglobin (MCH) and mean corpuscular hemoglobin concentration (MCHC) using Automated Hematology Analyzer (Cell–Dyn 3700, Abbott Diagnostics, USA).

DATA ANALYSIS
The data generated on erythrocytic indices were analyzed statistically using one way ANOVA model by sigma stat software, version 4.0, 2016 (Snedecor and Cochran, 1994).

RESULTS AND DISCUSSION
The mean and standard error (mean±S.E.) values of erythrocytic indices of different experimental groups of Kutchi camels are presented in Table 1.

Table 1: Erythrocytic indices during different stages of lactation in Kutchi camels

Mean ± S.E with different superscripts in rows differ significantly (p<0.05).

TEC= Total erythrocytes count, Hb= Haemoglobin, PCV= Packed cell volume, MCV= Mean corpuscular volume, MCH= Mean corpuscular hemoglobin, MCHC= Mean corpuscular hemoglobin concentration.

TOTAL ERYTHROCYTE COUNT
Result showed that the TEC was significantly (p< 0.05) lower in mid lactation as compared to late lactation. It was observed that the recorded data were comparable with the earlier studies (Hussein et al., 1992; Farooq et al., 2011; Mohamed and Hussein, 1999). Lower RBC concentration in mid lactation may indicate a negative correlation between higher milk production and RBCs concentration in lactating animals. However, Al-Busadah and Osman (2000) reported higher values of TEC as compared to the present study in lactating camels. Similarly, Tharwat et al. (2015) and Hagawane et al. (2009) reported the higher values of TEC than the result obtained in this study. El-Tarabany et al. (2016) observed the higher values of TEC in baladi goats than values obtained in present study. This difference may be ascribed to differences in breed and in the physical and environmental conditions.
Hb concentration obtained in this study is in agreement with the values reported in previous studies (Farooq et al., 2011; Mohamed and Hussein, 1999; Al-Busadah and Osman, 2000). The increased hemoglobin content in early lactation than in mid and late lactation in camels was probably due to higher demand for oxygen and the requirements of higher metabolic rate during and after parturition. However, results obtained in present study were higher than that reported by Hussein et al. (1992), Hagawaneet al. (2009), El-Tarabany et al. (2016) and Nozad et al. (2012). The haemoglobin (Hb) concentration found in Kutchi camels during early lactation in this study was lower than reported by Tharwat et al. (2015) during first three weeks of lactation after parturition in camels. The change in the values of Hb may be due to the climatic and geographic conditions.

**MEAN CORPUSCULAR VOLUME**
The PCV values obtained in different groups of Kutchi camels did not differ significantly. However, lower values of PCV have been found in early and mid lactation as compared late lactation (Al-Busadah and Osman, 2000; Tharwat et al., 2015). This may be due to elevated erythrocyte devastation in mammary cells along with mobilization of water to mammary gland. PCV values observed in Kutchi camels in this study corroborate the reports of Hussein et al. (1992) and Farooq et al. (2011). The values of PCV observed by Nozad et al. (2012) in Holstein dairy cows were higher than values found in present study during early and mid-lactation. Hagawane et al. (2009) also reported the higher values of PCV in lactating buffaloes.

**MEAN CORPUSCULAR HEMOGLOBIN**
The MCH concentration of mid lactation was significantly (p < 0.05) higher than late lactation. However, non-significant difference found between early and mid lactation as well as early and late lactation. The mean corpuscular haemoglobin (MCH) values recorded in present study were comparable with the values determined by previous reports (Hussein et al., 1992; Farooq et al., 2011; Mohamed and Hussein, 1999). The findings of Al-Busadah and Osman (2000) were lower than the findings of this study.
AUTHORS CONTRIBUTION

Abdul Lateef and Nilufar Haque designed the experiment. Axay Joshi and Ajay Patel collected the blood sample and carried out the experiment. Axay Joshi and Nilufar Haque prepared the manuscript. Nilufar Haque and Pankaj Patel revised the final draft of the manuscript. All authors read and approved the final manuscript.
